

Week 2

# Game Loop Programming

Instructor: Hooman Salamat

## Objectives

- Explore an example game loop
- Review and apply the concepts of frames, frame rates and fixed time steps
- Create and display sprites to the game window

#### Friend function

 A friend function of a class is defined outside that class' scope but it has the right to access all private and protected members of the class.

```
class Box {
double width;

public:
double length;
friend void printWidth(Box box);
void setWidth(double wid);
};
```

#### **Default Constructor**

- Class myClass {}
- the compiler provides you a default zero argument constructor, along with a destructor, a copy constructor, and a copy assignment operator.

#### **Implicit Conversion**

```
#include <iostream>
using namespace std;
class complexNumbers {
double real, img;
public:
//default constructor
complexNumbers() : real(0), img(0) { }
//copy constructor
complexNumbers(const complexNumbers& c) { real = c.real; img = c.img; }
//implicit conversion
complexNumbers(double r, double i = 0.0) { real = r; img = i; }
//friend function
friend void display(complexNumbers cx);
void display(complexNumbers cx) {
cout << "Real Part: " << cx.real << " Imag Part: " << cx.img << endl;</pre>
int main() {
complexNumbers one(1);
complexNumbers five = 5; //copy assignment operator
display(one);
display(five);
display(300); //② Implicit conversion
return 0;
```

#### **Explicit constructor**

 The explicit function specifier controls unwanted implicit type conversions. It can only be used in declarations of constructors within a class declaration.

```
explicit complexNumbers2(double r, double i = 0.0)
{ real = r; img = i; }
complexNumbers2 one(1);
//complexNumbers2 five = 5; //not allowed using explicit
display2(one);
//display2(300); // Implicit conversion not allowed
```

## Sf::Shape

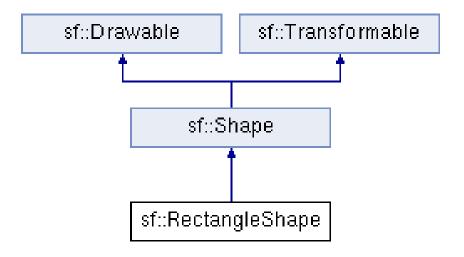

Base class (abstract) for textured shapes with outline

# Sf::RectangleShape

RectangleShape (const <u>Vector2f</u> &size=<u>Vector2f(0, 0)</u>)

### Sf::ConvexShape

Creates a convex polygon.

```
sf::ConvexShape mPolygon;
```

```
mPolygon.setPointCount(3);
mPolygon.setPoint(0, sf::Vector2f(0, 0));
mPolygon.setPoint(1, sf::Vector2f(0, 50));
mPolygon.setPoint(2, sf::Vector2f(50, 50));
mPolygon.setFillColor(sf::Color::Magenta);
mPolygon.setOutlineColor(sf::Color::Red);
mPolygon.setOutlineThickness(5);
mPolygon.setPosition(400, 400);
```

## Sf::Image

Class for loading, manipulating and saving images.

```
sf::Image mImage;
mImage.create(20, 20, sf::Color::Yellow);
sf::Color color = mIcon.getPixel(0, 0);
color.a = 0; //make the top-left pixel transparent
color.r = 0; //set the r = 0 (rgb) from the color
mIcon.setPixel(0, 0, color);
// Save the image to a file
if (!mImage.saveToFile("Media/Textures/result.png"))
cout << "Cannot save my image to Textures folder " <<
endl;</pre>
```

# How to set an Icon for the window

```
sf::Image mIcon;
mIcon.loadFromFile("Media/Textures/icon.png");
mWindow.setIcon(mIcon.getSize().x, mIcon.getSize().y,
mIcon.getPixelsPtr());
```

#### Font and Text

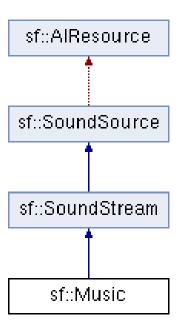

Create a graphical text to display

```
sf::Font mFont;
sf::Text mText;
if
(!mFont.loadFromFile("Media/Sansation.ttf"))
return;
mText.setString("Hello SFML");
mText.setFont(mFont);
mText.setPosition(5.f, 5.f);
mText.setCharacterSize(50);
mText.setFillColor(sf::Color::Black);
```

#### Sf::Music

Streams music played from an audio file

# Play the Music

- Streamed music played from an audio file
- Musics are sounds that are streamed rather than completely loaded in memory
- A music is played in its own thread in order not block the rest of the program
- Supported audio formats: ogg, wav, flac, aiff, au, raw, paf, svx, nist, voc, ircam, w64, mat4, mat5, pvf, htk, sds, avr, sd2, caf, wve, mpc2k, rf64

#### **Music Parameters**

```
#include <SFML/Audio.hpp>
sf::Music mMusic;
mMusic.openFromFile("Media/Textures/nice m
usic.ogg");
//change some parameters
mMusic.setPosition(0, 1, 10); //change its
3D position
mMusic.setPitch(2); //increase the pitch
mMusic.setVolume(50); //reduce the volume
mMusic.setLoop(true); //make it loop
mMusic.setAttenuation(100);
mMusic.play();
```

#### Game Loop

 The run() function you saw in the example from last week, and below, is known as the main loop or game loop

```
void Game::run()
{
   while (mWindow.isOpen())
   {
     processEvents();
     update();
     render();
   }
}
```

#### Game Loop (cont'd.)

- It processes all the components in the game and continues to do so until the application is terminated
- The processing of events, updating of all game assets and then rendering them to the destination output is a standard loop for games

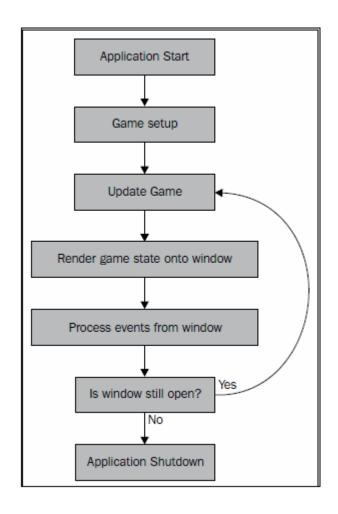

#### Game Loop (cont'd.)

- It processes all the components in the game and continues to do so until the application is terminated
- The processing of events, updating of all game assets and then rendering them to the destination output is a standard loop for games
- You've heard the term frame or tick before, and that is what we call an iteration of the loop

#### Game Loop (cont'd.)

 The flowchart to the right illustrates the logic and different processes of the game, including the main loop

#### **Events**

- Events can be user-generated such as mouse clicks or movement or keyboard presses
- They can also be generated by the assets in the game, such as when an enemy spots the player
- We don't have any events in our example yet, so let's create some!
- How 'bout moving that circle with the keyboard?

#### Events (cont'd.)

- For events in SFML, we use the sf::Event object
- We're going to use two events for this example:

```
sf::Event::KeyPressed and sf::Event::KeyReleased
```

#### processEvents()

```
void Game::processEvents()
   sf::Event event;
   while (mWindow.pollEvent(event))
      switch (event.type)
         case sf::Event::KeyPressed:
          handlePlayerInput(event.key.code, true);
          break;
         case sf::Event::KeyReleased:
          handlePlayerInput(event.key.code, false);
          break;
         case sf::Event::Closed:
          mWindow.close();
          break;
```

#### handlePlayerInput()

```
void Game::handlePlayerInput(sf::Keyboard::Key key, bool isPressed)
{
    if (key == sf::Keyboard::W)
        mIsMovingUp = isPressed;
    else if (key == sf::Keyboard::S)
        mIsMovingDown = isPressed;
    else if (key == sf::Keyboard::A)
        mIsMovingLeft = isPressed;
    else if (key == sf::Keyboard::D)
        mIsMovingRight = isPressed;
}
```

#### New update()

```
void Game::update()
   sf::Vector2f movement(0.f, 0.f);
   if (mIsMovingUp)
     movement.y -= 1.f;
   if (mIsMovingDown)
     movement.y += 1.f;
   if (mIsMovingLeft)
     movement.x -= 1.f;
   if (mIsMovingRight)
     movement.x += 1.f;
  mPlayer.move(movement);
```

#### How about mouse?

```
if (sf::Mouse::isButtonPressed(sf::Mouse::Left))
{
    sf::Vector2i mousePosition =
    sf::Mouse::getPosition(mWindow);
    mPlayer.setPosition((float)mousePosition.x,
    (float)mousePosition.y);
}
```

## **Vector Object**

SFML's Vector object is instantiated as:

```
sf::Vector2<float>
```

• We use the typedef for variable declarations, which is as follows:

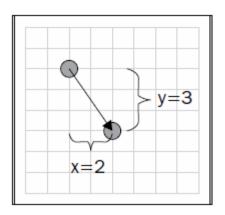

```
sf::Vector2f myVector(0.f, 0.f);
```

 As you would expect, there are many common operations in the Vector class that we can access through a Vector object

### Vector Object (cont'd.)

- In games, vectors can represent coordinates or a direction to move
- The diagram below represents a vector(2,3) and it could be a translation of 2 units to the right and 3 down:

## Frame-Independence

- You might remember from Unity that we were able to move an object a certain number of units per second
  - We multiplied the speed by Time.deltaTime
- We can do this in SFML too, so that the player's movement isn't dependent on the framerate – or number of times the update runs per second

## Frame-Independence (cont'd.)

- Well, we're still relying on the framerate, but the movement is spread out evenly over the frames
- So let's have a look at our new update function and see what's new...

#### New update ()

```
void Game::update(sf::Time deltaTime)
  sf::Vector2f movement(0.f, 0.f);
  if (mIsMovingUp)
    movement.y -= PlayerSpeed;
  if (mIsMovingDown)
    movement.y += PlayerSpeed;
  if (mIsMovingLeft)
    movement.x -= PlayerSpeed;
  if (mIsMovingRight)
    movement.x += PlayerSpeed;
  mPlayer.move(movement * deltaTime.asSeconds());
```

# **Measuring Frames**

- We can measure the time each frame takes in order to figure out deltaTime
- We use the sf::Clock class
- Sf::Clock has only two methods: getElapsedTime() and restart(). Both returns the elapsed time since the clock was started and then it resets the clock to zero. getElapsedTime() can be called without calling restart()

```
sf::Clock clock;
sf::Time time = clock.getElapsedTime();
float seconds = time.asSeconds();
sf::Int32 milliseconds = time.asMilliseconds();
sf::Int64 microseconds = time.asMicroseconds();
time = clock.restart();
```

### Measuring Frames (cont'd.)

```
void Game::run()
  sf::Clock clock;
  while (mWindow.isOpen())
    sf::Time deltaTime = clock.restart();
    processEvents();
    update(deltaTime);
    render();
```

## **Fixed Time Step**

- Time based on a system function such as a while loop will never be constant
  - We saw this way back with HTML5 and its highlyvarying frame rate
  - Unity too!
- Fortunately we can create fixed time execution using a counter and a check
  - The while loop is definitely going to execute fast enough to serve as very small time increments added to our counter variable

### Fixed Time Step (cont'd.)

```
void Game::run()
  sf::Clock clock;
  sf::Time timeSinceLastUpdate = sf::Time::Zero;
  while (mWindow.isOpen())
     processEvents();
     timeSinceLastUpdate += clock.restart();
     while (timeSinceLastUpdate > TimePerFrame)
       timeSinceLastUpdate -= TimePerFrame;
       processEvents();
       update(TimePerFrame);
     render();
```

## Fixed Time Step (cont'd.)

- If you want to read more on this topic, you can read the article at the following address:
  - http://gafferongames.com/game-physics/fixyour-timestep

## **Displaying Sprites**

```
sf::Texture texture;
if (!texture.loadFromFile("path/to/file.png"))
 // Handle loading error
sf::Sprite sprite(texture);
sprite.setPosition(100.f, 100.f);
window.clear();
window.draw(sprite);
window.display();
```

# Rendering

- Rendering is the process of drawing your assets to the screen
- Ideally, we'd only want our assets being drawn if they were updated somehow in the program
  - Would save on performance
- However, real-time rendering just draws to the screen as fast as possible

# Rendering (cont'd.)

- Have you ever wondered why there is an FPS count in games? Like 30 or 60
- It's because the end user can't see blindinglyfast updates so the frame rate is limited to allow the processor to perform other tasks

## Rendering (cont'd.)

- Double buffering is a technique of rendering that uses two virtual windows or screens, called buffers
  - Front and back buffers
- The front buffer is what the user sees
- The back buffer is what's going to be drawn next frame – will become the front buffer

# Adding the Sprite

```
// Game.hpp
class Game
  public:
    Game();
  private:
    sf::Texture mTexture;
    sf::Sprite mPlayer;
};
```

## Adding the Sprite (cont'd.)

```
// Game.cpp
Game::Game()
 mTexture()
 mPlayer()
     (!mTexture.loadFromFile("Media/Textures/Eagle.png"))
    // Handle loading error
  mPlayer.setTexture(mTexture);
  mPlayer.setPosition(100.f, 100.f);
```

## Appendix B – Code Editor Tips

- Zoom
  - Press Ctrl+Mouse wheel to increase and decrease the font size
- Box Selector
  - Select rectangular region, type a line, and have that line repeated for every line part of the region
    - Hold Alt while using mouse to make vertical section
    - Start typing...typed line appears on every line in region
- Generate from Usage
  - Type method invocation without first creating method
    - Ctrl + dot (.) automatically generates heading

# Appendix C – Visual Studio Configuration

- When Visual Studio is launched, Start Page is displayed
  - Checkbox in extreme left corner Show page at startup
    - Check/uncheck Close page after project load to add/remove Start page tab from development environment
- Pin a project so it is always there
  - Pushpin is revealed when you move mouse over Recent projects area

# Customizing

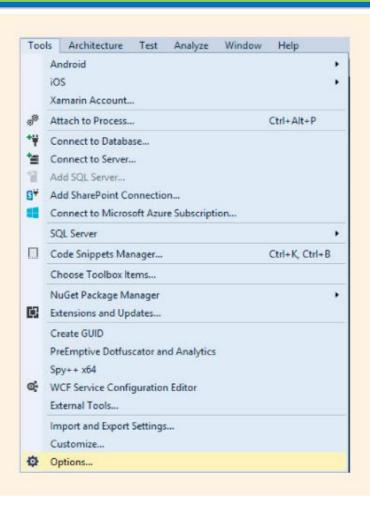

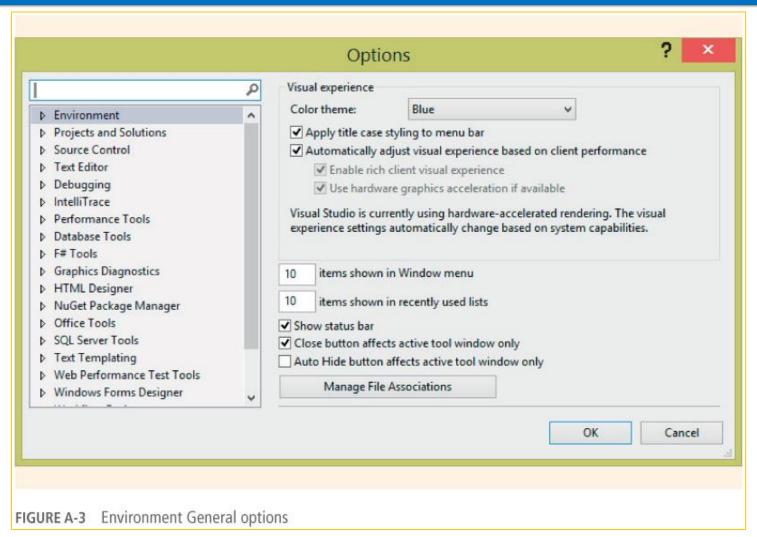

FIGURE A-2 Using Tools, Options to configure Visual Studio

#### **Environment**

#### **Environment**

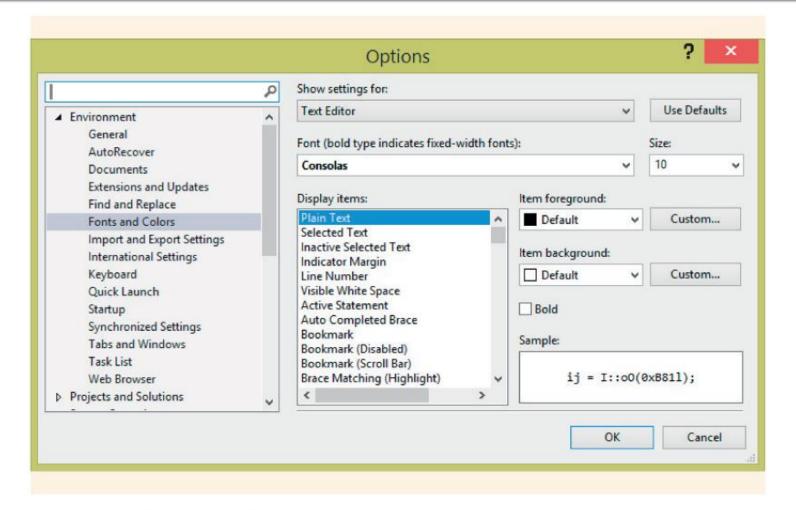

FIGURE A-4 Setting the fonts and colors

#### **Environment**

- Environment, Startup node lets you determine what is opened when you first start Visual Studio
  - Show Start Page, Open Home Page, Load last loaded solution, Show Open Project dialog box, Show New Project dialog box, or Show empty environment
- Set the URL for your Home page and Search page from Environment, Web Browser node
